NORTHISLE BEGINS DRILLING AT ITS PEMBERTON HILLS TARGET

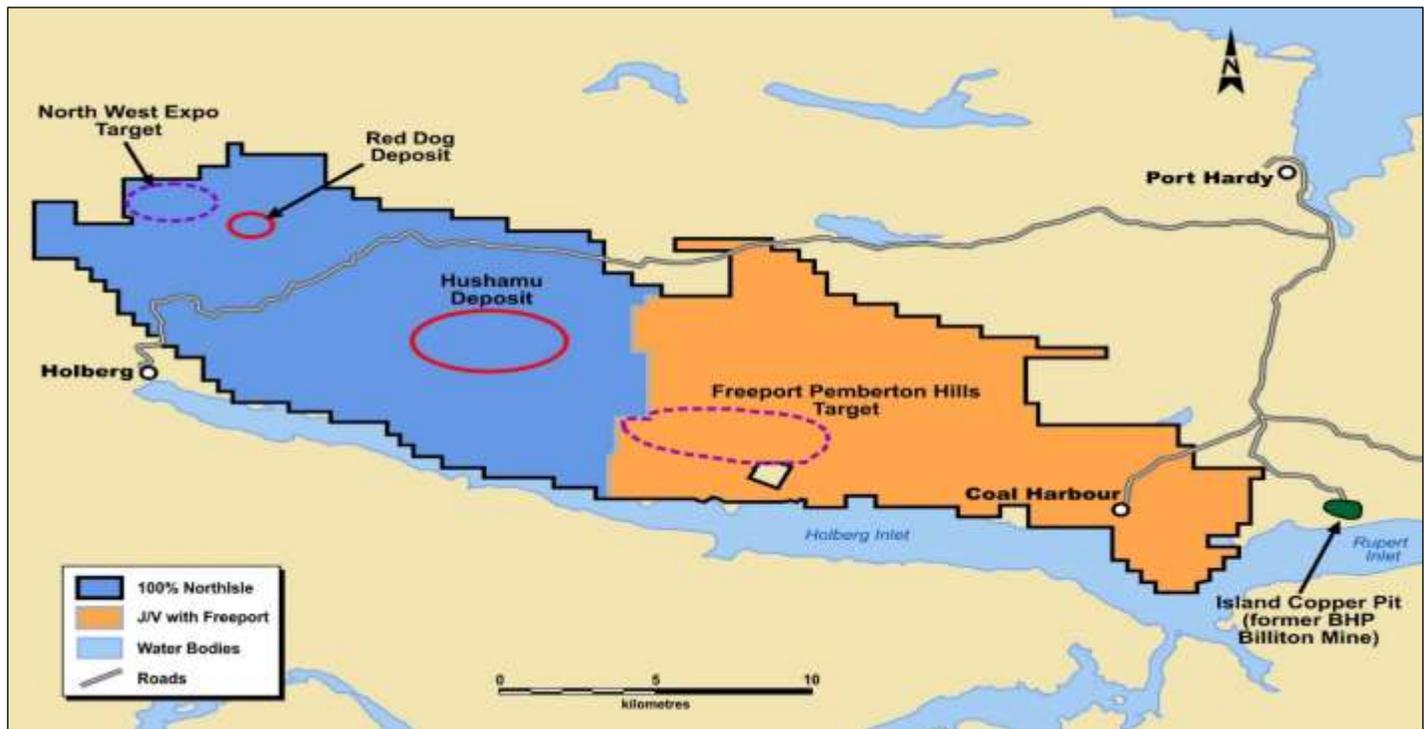

HIGHLIGHTS

- **Drilling has commenced on the Pemberton Hills target after a farm-out agreement was formed earlier this year with Freeport-McMoRan Mineral Properties Canada Inc. (“Freeport”)**
- **The Pemberton Hills target is a 3.5km by 1.5km area of advanced argillic alteration similar to that observed at Northisle’s 100%-owned Hushamu and Red Dog copper-gold deposits**
- **The presence of anomalous copper intersected at the end of an historical 200 metre deep drill hole, within the altered area, suggests evidence of a buried porphyry copper deposit at the Pemberton Hills target**
- **Following the recently completed initial 10km of Induced Polarization (IP) geophysical survey, a further 5km survey has been planned**
- **The initial diamond drilling program, which is currently underway, has also been increased from 1,500m to 2,500m**

Vancouver, B.C. – Northisle Copper and Gold Inc. (TSX-V:NCX) (“Northisle” or the “Company”) is pleased to announce that drilling has commenced on its Pemberton Hills Property located on Vancouver Island, in British Columbia. Northisle entered into a farm-out agreement with Freeport-McMoRan Mineral Properties Canada Inc. (“Freeport”) earlier this year.

John McClintock, President and CEO of Northisle stated: “We are excited to launch this first drill program on the Pemberton Hills target with the funding and technical support provided by Freeport. Furthermore, we are encouraged by Freeport’s decision to increase the initial drill program. The alteration at Pemberton is very similar to what we see at our Hushamu and Red Dog deposits and in porphyry copper systems found elsewhere in the world. We already have evidence of a buried porphyry copper deposit as demonstrated by anomalous porphyry copper mineralization found at the end of an historical hole drilled within the altered area.”

As shown in the figure below, the Pemberton Hills target is a 3.5 kilometre by 1.5 kilometre area of advanced argillic alteration located within the same geological terrain that extends west-northwest from BHP Billiton’s past producing Island Copper Mine. The presence of anomalous copper intersected at the end of an historical 200 metre deep drill hole, within the altered area, suggests evidence of a buried porphyry copper deposit.

Approximately ten kilometres of Induced Polarization (IP) geophysical survey has been completed and a further 5 kilometres remains to be completed. The initially planned 1,500 metres of diamond drilling in three holes, has been increased to approximately 2,500 metres in 4 or 5 holes. The overall planned budget has been increased from CAD 700,000 to CAD \$1,000,000.

A farm-out agreement was formed with Freeport earlier this year, dividing the initial property held by Northisle as illustrated in the figure above. Under the terms of the agreement, as announced on February 26, 2018, Freeport may earn up to a 65% interest in the Pemberton Hills Property by funding a total of \$23.9 million in exploration expenditures, while Northisle retains a 100% interest in its Hushamu and Red Dog copper-gold deposits and surrounding areas, for which a Preliminary Economic Assessment was published on September 13, 2017.
